Contributions:

- Brandt Swanson (25%)
 - Some of Saving profiles to firebase
 - Some of Editing profiles in firebase
 - Some of Uploading profile pictures to firebase from login and edit profile
- Joseph Graham (25%)
 - Some of Saving profiles to firebase
 - Some of Editing profiles in firebase
 - Some of Uploading profile pictures to firebase from login and edit profile
 - Showing current location
 - Saving to core data log in information to allow for automatic log in
 - Ability to log out, and delete saved profile info
 - Created Settings Bundle and access to iOS settings from notifications screen
- Michael Rodriguez-Labarca (25%)
 - Saving created events locally
 - Upload pictures for events
 - Upload description for events
- Roger Zhong (25%)
 - logout
 - Save event to database
 - Create a pin from the address
 - Load events in from database
 - Create map pins from saved events
 - Click on pin to look at event information
 - view/delete created events from user profile
 - bug fixes

Deviations:

- Got close to editing events but couldn't finish for this build
- Create event still needs some work on Q&A and uploading pictures, so viewing events doesn't have these sections
- The current event details screen is a placeholder that we can build on once we start fleshing out the UI more
- No community management
- Currently no liking system for events
- Cannot RSVP an event
- Map filters and search do not apply to events on screen
- No pin size algorithm

Other Notes:

- In the Create Event page when editing the description, the screen will move upwards, which is intentional. When using software keyboard, we don't want keyboard to block view
- Works best with iPhone 11 Pro Max
